Dale R. Patrick, Stephen W. Fardo : Energy Management Conservation before purchasing it in order to gage whether or not it would be worth my time, and all praised Energy Management Conservation:

The book deals primarily with energy management and conservation in existing buildings. However, there are many suggestions in the book that should be considered in both the design of new buildings and the remodeling of existing buildings. It provides a thorough and practical discussion of the operation of the systems that are found in most types of buildings.
